Education

Bachelor of Engineering (B.Eng), Computer Engineering

Toronto Metropolitan University

Sep 2022 - May 2027

Toronto, ON

Technical Skills

Controls & Automation: Building automation systems, commissioning, L3/L4 verification, field device testing, control wiring, panel retrofits, system startup, equipment troubleshooting

Communication Protocols: Modbus, BACnet, RS-485, gateway setup, device configuration, network troubleshooting

Electrical & Instrumentation: Valves, temperature transmitters, temperature/humidity sensors, flow meters, differential pressure sensors, power supplies, control panels

Engineering Documentation: Commissioning checklists, test records, redlines, issue tracking, technical reporting, customer-site communication

Programming & Tools: Studio 5000, Python, C, SQL, VHDL, Java, Git/GitHub, Linux/Unix, VS Code

Experience

Controls Systems Engineer Co-op

ProAutomated

May 2025 - Aug 2026

Customer Sites Across U.S.

- Completed a **16-month field-based controls and commissioning co-op** supporting customer-site startup, verification, troubleshooting, and documentation for building automation and control systems across U.S. data center environments.
- Executed **L3/L4 commissioning and verification** for **100+ field devices**, including valves, temperature transmitters, temperature/humidity sensors, flow meters, differential pressure sensors, gateways, and related control equipment.
- Independently supported commissioning scopes across **5+ hyper-scale datacenters**, including panel retrofits, power supply replacements, control wiring updates, gateway installation, device configuration, and startup checks.
- Troubleshoot **Modbus, BACnet, and RS-485** communication issues by verifying wiring, device addressing, baud rates, network behavior, and field device operation to isolate root causes.
- Documented **300+ commissioning records**, including checklists, test results, photos, redlines, and issue notes to maintain project traceability and support engineering handoff.
- Communicated technical findings with commissioning managers, field teams, and customer stakeholders to resolve site issues and keep startup activities moving.

Autonomous Navigation Software Team Member

Toronto Autonomous Systems Collective - Innovation Boost Zone

Sep 2024 - May 2025

Toronto, ON

- Collaborated with a multidisciplinary engineering team on autonomous rover development, supporting troubleshooting, documentation, and technical issue resolution.
- Created and maintained comprehensive project documentation, facilitating clear communication among cross-functional teams and ensuring efficient knowledge transfer.
- Investigated and resolved technical issues alongside team members, using online resources and collaborative brainstorming to deliver timely, effective solutions.

Engineering Projects

AI Digit Recognition App 🤖

Python | OpenCV | TensorFlow

- Built a Python-based image recognition application using OpenCV and TensorFlow, achieving **90% prediction accuracy** across **500+ test inputs**.
- Processed image data into machine-readable inputs, reducing image processing overhead by **25%**.

GO Transit Data Integration Bot 🤖

JavaScript | Node.js | REST API Integration

- Integrated external REST APIs to retrieve live transit schedule and service-alert data, enabling real-time information access for **50+ active users**.
- Optimized asynchronous data requests and response handling, reducing average response time from **500ms to 350ms**.
